SSH Access Configuration

To enable secure command-line access to EC2 instances, I generated a key pair in the AWS Management Console named 'networking-key-pair.pem'. This key was used to SSH into instances from an authorized IP address (my personal machine's IP: 3.144.19.159). The private key was securely stored and never shared. The corresponding Security Group for the Bastion Host was configured to allow SSH access only from this IP address, ensuring tightly controlled administrative access to the environment.
